Title: FastBot Test Knowledge Base

Content:
FastBot is a chatbot designed to answer user questions using retrieval-augmented generation.
It was built using Django for the backend and React for the frontend.
The system loads documents, converts them into embeddings, and retrieves the most relevant chunks before generating an answer.

The chatbot uses the LangChain library and Chroma as a vector database.
The goal of FastBot is to make it easy to search through knowledge sources such as PDFs and JSON files.
